1 Summary

This paper outlines a proposal for the development of a robot to assist in the caretaking of elderly and disabled people.

It is stated that the main goal of the paper is “to demonstrate the capabilities of a mobile personal assistance robot using ‘simple’ image processing.”

The paper then provides preliminary examples related to the area. It cites two papers that detail applications similar to the intended goal.

2 Decision

The final decision of this review is that this paper requires significant revision. Although the topic is well motivated, the execution falls short in several regards, as outlined below.

3 Major Concerns

12.5times within the coming 5 years.

A first major concern with this paper is the lack of a clear research contribution.

In addition to this, the paper is speculative rather than experimental. It is clearly stated that the goal of the paper is “to demonstrate the capabilities of a mobile personal assistance robot using ‘simple’ image processing.” Despite this, no outcome seems to have been achieved in the paper, with the evaluation section being seemingly purely speculative.

Lack of technical depth

4 Minor Concerns

Poorly worded introduction

Grammar

Missing words

” This is a broad topic with many different applications in both health care and non-commercial. ” items an elderly has

Spelling mistakes: (partially repetitive and simple ones) Furthermore, logistic needs such as medicine retrieval can be performed without personnel hospital personnel

incorrect plurals follow a similar criteria

missing articles Arduino mega 2560 is used for the large number of digital pins

redundancy: The robot must be seamless and operate effectively within its environment even to the extent of operating effectively within an unfamiliar environment that it was not designed for in a way that does not compromise human safety

This paper presents a mobile robot for elderly and disabled assistance

missing punctuation No obstacle detection is performed, hence the robot will bump into any objects
The robot will stop if it cannot find the marker.

corrupted used. -¿ arco principes of operation

Figure 1: Follower robot not present

Subsections formatted strangely e.g. Approach
